

UNIL | Université de Lausanne

Dear colleague,

I am looking to recruit a postdoc and a **PhD student** on a project on "**Selection on gene expression at different time scales and vertebrate EvoDevo**", and I would be grateful if you could pass this around to students and young researchers who might be interested. The postdoc position has a more evolutionary profile and the PhD position has a more bioinformatics profile, but I will consider a wide range of applications, and eventually adapt the projects to the people recruited, so please encourage people to apply!

Postdoc in evolutionary genomics, who will take the lead on general patterns of selection and variability in animal evolution, job description and instructions to apply: <https://bit.ly/3zccixs>

PhD student in bioinformatics, who will take the lead on on new method development and data integration, job description and instructions to apply: <https://bit.ly/3PRA4Vp>

Both positions are open to all nationalities. For the postdoc, candidates must have received their PhD in the last 2 years or be about to obtain a PhD very soon, due to rules from the SNSF.

Thank you for your help!

Best regards,
Marc
