Interested in the study of animal behaviour and brain evolution!

Opportunities for a master or degree project to implement the use of deep learning tools in the quantification of behaviour of guppies. You will apply these tools in experiments aimed at assessing the genetic mechanisms underlying behavioral decisions in this fish. Prior experience with these tools is not required, only an interest in learning how to apply them! Start date and project duration are flexible (should be during 2024). More info about the research topics can be found on:  [https://larroca.github.io/](https://larroca.github.io/)
