Master Degree Project in food toxicology

We are looking for a highly motivated MSc student to join the Molecular Toxicology group at SLU Uppsala (Molecular Toxicology | Externwebben (slu.se)). The project will focus specifically on investigated molecular mechanisms of toxic and bioactive chemicals present in food items or package materials. Individual projects of interest are Master Degree Projects (Examensarbete: 30/45 hp). The project will utilize cell-based in vitro model, which are of great value for studying toxicity pathways.

The project is laboratory-based and expected to start earliest at the autumn of 2021. The candidate is expected to plan and perform experiments in the laboratory, handle data and interpret results. It is important that the student can work independently as well as a part of a team. Previous experience in cell culturing is desirable, but not a requirement.

If the project is of interest, please send your cover letter and questions to us.
